

DESIGN JOURNAL

REESE OXNER — NOV TO DEC. 2019

- 1) I chose a simple layout for this website, creating a clean template where the services and images of the services could easily be found.
- 2) I used PHP include on every element I could, to make the site very easy to update and maintain.
- 3) I used CSS, PHP and SQL to generate webpages for each example of my client's work — this allows him to upload work as he completes it and negates the need to code an individual website for every image.
- 4) I used CSS to make the website mobile-friendly.
- 5) Creating the grid hovers on the content pages makes the portfolio items eye-catching and enticing.
- 6) Using databases will make this site easy to update, maintain and keeps it very consistent.
- 7) Using the images as the primary indicator of quality is better because it's easier to show than tell.
- 8) The backend systems are as simplistic as possible for ease of use.
